Tech Akhil SEO Audit Tool

Setup, Usage & Reference Guide

Version 1.9.8 • WordPress plugin review candidate

AUDIT • PRIORITIZE • IMPROVE

A practical guide to installing the plugin, publishing the audit form, understanding findings, and using the available tools.

1. About this guide

This guide describes Tech Akhil SEO Audit Tool v1.9.8. The plugin checks selected on-page and technical SEO signals, then groups findings into Critical, Warning, and Notice categories with a prioritized action plan. It is a practical checklist, not a guarantee of rankings or a complete technical/security audit.

At a glance

Platform	WordPress
Plugin version documented	1.9.8
Minimum WordPress version	6.2
Minimum PHP version	7.4
Shortcode	[seo_audit_checklist_tool]
Creator	Akhilesh Kumar Meena · Tech Akhil

Before updating a production website: make a backup and, when available, test on a staging site first. Compatibility claims should be based on versions actually tested.

2. Installation & setup

Install from the plugin ZIP

1. Sign in to WordPress with an administrator account.
2. Open **Plugins** → **Add New Plugin** → **Upload Plugin**.
3. Choose the Tech Akhil SEO Audit Tool ZIP, install it, and activate it.
4. Create or edit a page and add `[seo_audit_checklist_tool]` in a Shortcode block or a supported page-builder shortcode widget.
5. Publish the page and open it to test the audit form.
6. Use the **SEO Audit** menu in WordPress Admin for the admin audit form, settings, and activity screens.

Shortcode

```
[seo_audit_checklist_tool]
```

Core workflow

1. Enter the website URL in the audit form.
2. Optionally provide a focus keyword and related keywords if keyword analysis is needed.
3. Run the audit and review the issue groups, page-level details, and prioritized action plan.
4. Use browser print/save-to-PDF for a printable report or generate a temporary CSV export when needed.

> The exact results depend on the submitted site, accessible pages, response times, and the signals that the crawler can extract.

3. Features and report interpretation

- Bounded same-host crawl of up to 30 pages, subject to a time budget.
- Critical, Warning, and Notice issue groups with expandable details.
- Prioritized action plan with estimated effort labels.
- Optional Focus Keyword Analyzer for one focus keyword and up to ten related keywords.
- Selected page title/meta description, heading, canonical/noindex, image-alt, links, duplicate-text, sitemap/robots, structured-data, viewport/language, UX, and response/security-header signals.
- Configurable report theme and accent colour.
- Audit Activity list with normalized audited domains and timestamps, date filters, one-year pruning, and a 2,000-record cap.

Focus Keyword Analyzer

The analyzer checks selected on-page locations such as the title, meta description, H1, extracted page text, opening text, URL slug, image alt text, and link text. Its score is an internal checklist indicator; it is not Google ranking data and does not provide keyword search volume or keyword difficulty.

External tools and integrations

- PageSpeed Insights: https://pagespeed.web.dev/ — opened as an external tool; the plugin does not make a server-side PageSpeed API call for the built-in audit.
- Google Search Console: https://search.google.com/search-console/ — optional administrator-authorized integration for an eligible property.
- Schema Markup Validator: https://validator.schema.org/ — external validation tool.

Print and CSV export

Use the browser print dialog to print or save the report as a PDF. CSV download tokens are single-use and expire after two hours. If a link expires or has already been used, run a new audit. Text cells that begin with spreadsheet formula characters are prefixed as a mitigation against CSV formula injection.

4. Settings, privacy and data handling

Report appearance

The settings screen allows the administrator to configure the report theme and accent colour and access external tool links and the optional Search Console connection.

Public attribution

Public “Powered by Tech Akhil” attribution is disabled by default. It appears on the public report only if the site administrator explicitly enables it in settings. Plugin-owned WordPress admin screens use a separate administrative footer.

Audit Activity data

Audit Activity stores the normalized audited domain and timestamp rather than the full submitted URL or visitor identity. Records are de-duplicated by domain and day, records older than one year are pruned, and the list is capped at 2,000 records. CSV export data is temporary and the download token is single-use.

Google Search Console

Connecting Search Console is optional. If an administrator connects an eligible property, the plugin communicates with Google to retrieve authorized Search Console data. OAuth credentials/tokens are stored in WordPress options while the connection is active. Review the site’s privacy notice and access permissions before connecting.

The plugin does not intentionally send analytics telemetry. PageSpeed Insights and Schema Markup Validator are external websites; opening them causes the browser to communicate with those providers under their own policies.

5. Limitations and troubleshooting

Important limitations

- The crawler does not execute JavaScript and cannot guarantee full-site coverage.
- Internal-link target checks are limited and may not identify every broken link.
- Structured-data checks are lightweight signals, not a complete schema validation service.
- Security-header checks are informational signals, not a penetration test or vulnerability assessment.
- Analytics, form-presence, UX, and visible-text checks are basic HTML heuristics.
- The plugin does not provide live rankings, search volume, keyword difficulty, or guaranteed ranking outcomes.

If the audit does not return expected results

1. Check that the submitted URL is correct and reachable from the WordPress server.
2. Check whether the site blocks requests, redirects repeatedly, requires authentication, or responds too slowly.
3. Try a smaller, publicly accessible site to distinguish target-site restrictions from plugin behaviour.
4. If using Search Console, confirm that an administrator connected the correct eligible property and granted access.
5. Run a fresh audit if a CSV export link has expired or already been used.

WordPress.org directory screenshots and banners

The screenshot captions in `readme.txt` are intended to correspond to real screenshots uploaded to the root `assets/` directory of the WordPress.org SVN repository. The screenshots, plugin icon, and banner are repository assets; they are not normally placed inside the installable ZIP. Use genuine screenshots from the running plugin rather than illustrative placeholders.

Reference brand marks included in this package

The package includes Tech Akhil wordmark and lettermark files in `docs/brand-assets/` for documentation/reference use. These files are not WordPress.org directory screenshots.

Version: 1.9.8 • Document refreshed for the v1.9.8 review candidate.
